

Apex QA Agent — Team Meeting Brief

Date: 4 Sep 2026 | **App:** Oracle APEX Endless Aisle (Titan/Tanishq UAT) | **GT session:** today

One-liner: Morning sanity + ad-hoc NL checks + multi-channel reports — deterministic-first runtime with LLM only for planning and summaries. No loop-until-success.

1. Client requirement

Need	Our answer
Morning sanity (scheduled)	08:00 IST patrol → login + home + key modules → report
Ad-hoc checks	NL command in console → plan → Playwright run → report
Reports	Email / WhatsApp / Teams (structured markdown + JSON)
Before Ground Truth	Phase A: technical rules + honest NEEDS_REVIEW
After SME GT (today)	Phase B: deterministic expected vs actual

2. Architecture (simple linear path — no OpenClaw)

```
Console (Next.js)
  → QA Orchestrator (thin: schedule, lock, budgets, report)
    → LLM Planner (Groq now → Claude later) + KB/GT RAG
    → Playwright Browser Executor (QA plugin)
    → Oracle APEX UAT
    → Validator (Phase A or B)
    → PASS / FAIL / NEEDS_REVIEW + report channels
```

LLM vs deterministic

Layer	Mode	Role
Budgets, routing, GT compare	Deterministic	Control plane — never LLM-owned
NL goal → plan	LLM	Groq free tier; Claude API later
Browser steps	Deterministic	Playwright navigate / click / screenshot
Pre-GT business checks	LLM + rules	NEEDS_REVIEW — no fake PASS
Post-GT business checks	Deterministic	Approved facts → PASS/FAIL

3. Ground Truth — today

- KB: **64** documents · GT candidates: **22**
- Checklist: `discovery/uat_ea/APPROVAL_CHECKLIST.md`
- Approved facts → `discovery/uat_ea/gt/` → validator Phase B

4. Folder structure

```
qa-console/           Web UI
src/base_agent/       Shared kernel (QA + Security)
src/qa_orchestrator/  Thin product path (sanity + adhoc)
plugins/qa_apex/      QA plugin (Playwright, skills)
plugins/security_*/   Security plugin (future, same kernel)
discovery/uat_ea/     KB + GT + approval checklist
scripts/             Local server + morning patrol
azure-pipelines.yml   CI → Docker → OCI deploy gate
```

5. QA + Security plugin model

Both agents share **base_agent** kernel, **GT store**, and **LLM gateway**. QA plugin owns browser flows; Security plugin adds authz/session subjects later — no runtime fork.

6. Requirements to complete (mainly QA)

Item	Status
GROQ_API_KEY (planner)	Needed from dev
APEX URL + credentials	Client vault — never git
SME GT approval (today)	Session today
SMTP / Twilio / Teams webhook	Client IT for live delivery
Azure DevOps + OCI registry	Client IT for deploy

7. Execution plan & source-code safety

Step	Where	Artifact
1 Local dev	Laptop	Full repo (our side)
2 CI test	Azure Pipelines	pytest + smoke
3 Package	Azure	Docker images only
4 Deploy	Client OCI	Pull image + vault secrets — no raw source

8. Tech stack

Layer	Choice	Why
Runtime	Python + Pydantic	Contracts for GT/KB; fast iteration
Browser	Playwright	Reliable APEX automation + evidence
LLM	LiteLLM → Groq/Claude	Swappable models, one gateway
UI	Next.js + TypeScript	Enterprise dark console
Deploy	Azure CI → OCI containers	Client residency + IP protection

9. Progress today

- Console UI, KB pack, orchestrator, Groq planner, Playwright path, 26 tests, pipeline skeleton
- **Next:** ingest SME GT → Phase B validation → live report channels → OCI deploy

10. Console UI screenshots

Enterprise dark console — Vercel/GitHub inspired. Deterministic-first QA with live traces and report delivery.
